| HITTS are an adherent pilibelial in incidentos incidente vielda loss or cell tire established from Syrian hamser is elect ells transformed with Aditional highly preferred incorporation, and glucosoricitoid exceptions. The cells secrets insulin, which is stimulated by glucoso and supressed by somenosation or glucosoricitoids.  ATTP 608.1-777 Res. Lord and Ashorott. Bookben. 2.19; 447–551. Sanderor et al. Pook. Mark Cal. 177 Res. Lord and Res. Control Experimental Cont | Klimes, sussy, Kinase, sussy, for the invention includes a method for recumple and GSR-5 kinase assay, for the invention includes an enthod for regulate gluose methodism and of all survival.  The standard are well-known in the art method for the invention modified to assess the ability of modified to assess the ability of modified to assess the ability of modified or an embodies of the invention of modified an embodies and agoniss or method for sumitating antipodies and agoniss or massed cell survival.  The standard are successed in the survival of the invention of modified and embodies and agoniss or the invention of modified and embodies of the invention of modified as the survival.  The standard is a survival.  The specific embodiment, skeled muscle end proliferation. In a movemion (including ambiodies and embodies and embodies of the invention modified as the standard and  |

| caspase apoptosis are well known in the art and may be used or routirely modified to assess the ability of polypeptides of the invention (including antibodies and agonists or | antigenaiss of the invention) to promote expose protesse-mediated apoptosis. Induction of apoptosis in endobthic leds supporting the vasculature of turnos is associated with tumor regression due to loss of tumor blood supply. Exemples assuss for exspace apoptosis that may assuss for exspace apoptosis that may | to the case of remaining the case of the case of the mineral of the case of the mineral of the case of the case of the mineral of the case of the mineral of the case of the c | (1996), the contents of each of which are therein monoproaded by reference in its entirety. Endothelial cells that may be used according to these assays are publicly available (e.g., however, and the content of the c |

|  |  | tumors, telangiectasia, bacillary      |
|--|--|----------------------------------------|
|  |  | angiomatosis,                          |
|  |  | hemangioendothelioma,                  |
|  |  | angiosarcoma,                          |
|  |  | haemangiopericytoma,                   |
|  |  | lymphangioma, lymphangiosarcoma.       |
|  |  | Highly preferred indications also      |
|  |  | include cancers such as, prostate,     |
|  |  | breast, lung, colon, pancreatic,       |
|  |  | esophageal, stomach, brain, liver,     |
|  |  | and urinary cancer. Preferred          |
|  |  | indications include benign             |
|  |  | dysproliferative disorders and pre-    |
|  |  | neoplastic conditions, such as, for    |
|  |  | example, hyperplasia, metaplasia,      |
|  |  | and/or dysplasia. Highly               |
|  |  | preferred indications also include     |
|  |  | arterial disease, such as,             |
|  |  | atherosclerosis, hypertension,         |
|  |  | coronary artery disease,               |
|  |  | inflammatory vasculitides,             |
|  |  | Reynaud's disease and Reynaud's        |
|  |  | phenomenom, aneurysms, restenosis;     |
|  |  | venous and lymphatic disorders such    |
|  |  | as thrombophlebitis, lymphangitis,     |
|  |  | and lymphedema; and other vascular     |
|  |  | disorders such as peripheral vascular  |
|  |  | disease, and cancer. Highly            |
|  |  | preferred indications also include     |
|  |  | trauma such as wounds, burns, and      |
|  |  | injured tissue (e.g., vascular injury  |
|  |  | such as, injury resulting from balloon |
|  |  | angioplasty, and atheroschlerotic      |
|  |  | lesions), implant fixation, scarring,  |
|  |  | ischemia reperfusion injury,           |
|  |  | rheumatoid arthritis, cerebrovascular  |
|  |  | disease, renal diseases such as acute  |

|    |         |     |                         |                                      | renal failure, and osteoporosis.                                 |

| invention (including antibodies and agonists or antagonists of the invention) to mobilize calcium. For example, the HPR assay may be used to measure influx of calcium.                | Cells normally have very low concentrations of cytosolic calcium compared to much higher extracellular existion. Extracellular factors can cause an influx of calcium, leading to activation of calcium, leading to activation of | calcular response ve signating pathways and alterations in cell functions. Exemplary assays that may be used or routinely modified to measure actions that by polypeptides of the invention (modifing amplies and agonisis or anatomistics of the invention) include antagonisis or anatomists of the invention include. | assays distoled in: Suin LS, et al.,<br>Endocrinology, 136(10)(4589-601 (1995); Morgaun II, et al.<br>(1995); Morgaun II, et al.<br>Endocrinology, 136(7):2860-6<br>(1995); Redantdown SB, et al.,<br>Bochen J, 236 (P. 19847-51<br>(1992); and, Mens, JE, et al., Cell<br>Colcium 1990; and, Mens, JE, et al., Cell<br>(1992); All All All All All All All All All Al | (1999), net comments it early on which is better in compounted by reference in settings; Praceratic cells han may be used according to these assays are publicly available (e.g., frontigh the ATCC**) and/or may be routined by ATCC**) and/or may be routined by agreented. Highly<br>preferred indications include        | autominime diseases (e.g.,<br>rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis                                         | immunodeficiencies (e.g., as     | described below). Additional highly   | preferred indications include         | inflammation and inflammatory          | disorders. Highly preferred  | indications also include neoplastic | diseases (e.g., leukemia, lymphoma, | and/or as described below under | "Hyperproliferative Disorders"). | Highly preferred indications include | neoplasms and cancers, such as, | leukemia, lymphoma, prostate,      | breast, lung, colon, pancreatic, | esophageal, stomach, brain, liver, | and urinary cancer. Other preferred | indications include benign             | dysproliferative disorders and pre- | neoplastic conditions, such as, for           | example, hyperplasia, metaplasia,   | and/or dysplasia. Preferred        | indications include arthritis, asthma, | AIDS, allergy, anemia, pancytopenia, | leukopenia, thrombocytopenia, | Hodgkin"s disease, acute | lymphocytic anemia (ALL), | plasmacytomas, multiple myeloma, | Burkitt"s lymphoma, granulomatous | disease, inflammatory bowel disease, | sepsis, psoriasis, suppression of | immune reactions to transplanted | organs and tissues, endocarditis, |

| promote or inhibit immune cell (e.g. T-cell) proliferation, activation, and | JNK and p38 kinase activity that may                               | be used or routinely modified to test TNK and p38 kinged induced activity | of polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | the assays disclosed in Forrer et al., | Biol Chem 379(8-9):1101-1110 | (1998); Gupta et al., Exp Cell Res  | 247(2): 495-504 (1999); Kyriakis    | M, Biochem Soc Symp 64:29-48    | (1999); Chang and Karin, Nature  | 410(6824):37-40 (2001); and Cobb     | MH, Prog Biophys Mol Biol 71(3- | 4):479-500 (1999); the contents of | each of which are herein         | incorporated by reference in its   | entirety. T cells that may be used  | according to these assays are publicly | available (e.g., through the        | ATCC <sup>TM</sup> ). Exemplary mouse T cells | that may be used according to these | assays include the CTLL cell line, | which is an IL-2 dependent             | suspension-culture cell line with    | cytotoxic activity.           |                          |                           |                                  |                                   |                                      |                                   |                                  |                                   |
|                                                                             |                                                                    |                                                                           |                                  |                                       |                                       |                                        |                              |                                     |                                     |                                 |                                  |                                      |                                 |                                    |                                  |                                    |                                     |                                        |                                     |                                               |                                     |                                    |                                        |                                      |                               |                          |                           |                                  |                                   |                                      |                                   |                                  |                                   |
|                                                                             |                                                                    |                                                                           |                                  |                                       |                                       |                                        |                              |                                     |                                     |                                 |                                  |                                      |                                 |                                    |                                  |                                    |                                     |                                        |                                     |                                               |                                     |                                    |                                        |                                      |                               |                          |                           |                                  |                                   |                                      |                                   |                                  |                                   |
|                                                                             |                                                                    |                                                                           |                                  |                                       |                                       |                                        |                              |                                     |                                     |                                 |                                  |                                      |                                 |                                    |                                  |                                    |                                     |                                        |                                     |                                               |                                     |                                    |                                        |                                      |                               |                          |                           |                                  |                                   |                                      |                                   |                                  |                                   |

| meningitis, and Lyme Disease. | A highly preferred indication is  | diabetes mellitus. An additional      | highly preferred indication is a     | complication associated with          | diabetes (e.g., diabetic retinopathy, | diabetic nephropathy, kidney disease | (e.g., renal failure, nephropathy | and/or other diseases and disorders as | described in the "Renal Disorders" | section below), diabetic neuropathy, | nerve disease and nerve damage         | (e.g., due to diabetic neuropathy), | blood vessel blockage, heart disease,  | stroke, impotence (e.g., due to     | diabetic neuropathy or blood vessel | blockage), seizures, mental           | confusion, drowsiness, nonketotic    | hyperglycemic-hyperosmolar coma, | cardiovascular disease (e.g., heart | disease, atherosclerosis,             | microvascular disease, hypertension,  | stroke, and other diseases and       | disorders as described in the      | "Cardiovascular Disorders" section | below), dyslipidemia, endocrine   | disorders (as described in the      | "Endocrine Disorders" section       | below), neuropathy, vision          | impairment (e.g., diabetic retinopathy | and blindness), ulcers and impaired | wound healing, and infection (e.g., | infectious diseases and disorders as | described in the "Infectious  | _                                 | of the urinary tract and skin), carpal | tunnel evndrome and Dumistren's |
|-------------------------------|-----------------------------------|---------------------------------------|--------------------------------------|---------------------------------------|---------------------------------------|--------------------------------------|-----------------------------------|----------------------------------------|------------------------------------|--------------------------------------|----------------------------------------|-------------------------------------|----------------------------------------|-------------------------------------|-------------------------------------|---------------------------------------|--------------------------------------|----------------------------------|-------------------------------------|---------------------------------------|---------------------------------------|--------------------------------------|------------------------------------|------------------------------------|-----------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|----------------------------------------|-------------------------------------|-------------------------------------|--------------------------------------|-------------------------------|-----------------------------------|----------------------------------------|---------------------------------|
|                               | Assays for measuring secretion of | insulin are well-known in the art and | may be used or routinely modified to | assess the ability of polypeptides of | the invention (including antibodies   | and agonists or antagonists of the   | invention) to stimulate insulin   | secretion. For example, insulin        | secretion is measured by FMAT      | using anti-rat insulin antibodies.   | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Shimizu, H., et | al., Endocr J, 47(3):261-9 (2000); | Salapatek, A.M., et al., Mol       | Endocrinol, 13(8):1305-17 (1999); | Filipsson, K., et al., Ann N Y Acad | Sci, 865:441-4 (1998); Olson, L.K., | et al., J Biol Chem, 271(28):16544- | 52 (1996); and, Miraglia S ct. al.,    | Journal of Biomolecular Screening,  | 4:193-204 (1999), the contents of   | each of which is herein incorporated | by reference in its entirety. | Pancreatic cells that may be used | according to these assays are publicly | Ornitohio o through the ATCCTM  |
|                               | Insulin Secretion                 |                                       |                                      |                                       |                                       |                                      |                                   |                                        |                                    |                                      |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                      |                                    |                                    |                                   |                                     |                                     |                                     |                                        |                                     |                                     |                                      |                               |                                   |                                        |                                 |

| and/or may be routinely generated.  Remplar paractic cells that may be used according to these assays the used according to these assays and address of the property of the pr | aways for the regulation of violity and proliferation of cells in vitro are well-known in the art and may be used rountinely modified to assess the ability of polypeptides of the invention (including anthodizes and agonisis or attagonists of the travention (including anthodizes and agonisis or attagonists of the travention) to longulate viability and proliferation of pancreatic beta cells polylication of pancreatic beta cells. Incumple of cell fitter-clid librariessent cell viability assay in callure based on quantitation of the AIP present which signals the cells. Exemplary assays that many be cells. Exemplary assays that may be cells. Exemplary assays that may be regulation of viability and coruntariely modified to test regulation of viability and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Exemplary assays that may be used or routinely modified to test for FAS monotone element activity (in | hepatocytes) by polypeptides of the invention (including antibodies and | agonists or antagonists of the     | invention) include assays disclosed in | Xiong, S., et al., Proc Natl Acad Sci | Roder, K., et al., Eur J Biochem, | 260(3):743-51 (1999); Oskouian B,     | et al., Biochem J, 317 ( Pt 1):257-65 | (1996); Berger, et al., Gene 66:1-10 | (1988); and, Cullen, B., et al.,     | Methods in Enzymol. 216:362-368 | (1992), the contents of each of which | is herein incorporated by reference in | its entirety. Hepatocytes that may be | used according to these assays, such | as H4IIE cells, are publicly available | (e.g., through the ATCCTM) and/or    | may be routinely generated.          | Exemplary hepatocytes that may be | used according to these assays | include rat liver hepatoma cell line(s) | inducible with glucocorticoids, | insulin, or cAMP derivatives.       | Kinase assay. Kinase assays, for | examplek Elk-1 kinase assays, for     | ERK signal transduction that regulate | cell proliferation or differentiation | are well known in the art and may be | used or routinely modified to assess | the ability of polypeptides of the      | invention (including antibodies and | agonists or antagonists of the         | invention) to promote or inhibit cell |
|                                                                                                       |                                                                         |                                    |                                        |                                       |                                   |                                       |                                       |                                      |                                      |                                 |                                       |                                        |                                       |                                      |                                        |                                      |                                      |                                   |                                |                                         |                                 |                                     | Activation of Skeletal           | Muscle Cell ERK                       | Signalling Pathway                    |                                       |                                      |                                      |                                         |                                     |                                        |                                       |

|--|----------------------------------------|
|  | impairment (e.g. dishetic retinonathy  |
|  | and blindness), ulcers and impaired    |
|  | wound healing, infection (e.g.,        |
|  | infectious diseases and disorders as   |
|  | <br>described in the "Infectious       |
|  | Diseases" section below, especially    |
|  | of the urinary tract and skin), carpal |
|  | tunnel syndrome and Dupuytren's        |
|  | contracture). An additional            |
|  | highly preferred indication is obesity |
|  | and/or complications associated with   |
|  | obesity. Additional highly preferred   |
|  | indications include weight loss or     |
|  | alternatively, weight gain.            |
|  | Aditional highly preferred             |
|  | indications are complications          |
|  | associated with insulin resistance.    |
|  | <br>Additional highly preferred        |
|  | indications are disorders of the       |
|  | musculoskeletal systems including      |
|  | myopathies, muscular dystrophy,        |
|  | and/or as described herein.            |
|  | <br>Additional highly preferred        |
|  | indications include: myopathy,         |
|  | atrophy, congestive heart failure,     |
|  | cachexia, myxomas, fibromas,           |
|  | congenital cardiovascular              |
|  | abnormalities, heart disease, cardiac  |
|  | arrest, heart valve disease, and       |
|  | vascular disease. Highly               |
|  | preferred indications include          |
|  | neoplasms and cancer, such as,         |
|  | rhabdomyoma, rhabdosarcoma,            |
|  | stomach, esophageal, prostate, and     |
|  | urinary cancer. Highly preferred       |
|  | indications also include breast, lung, |

Hepatocytes that may be used according to these assays such as HHIE cells, are publicly available, est, through the ATTCVP3 and/or may be routinely generated.  The Exemplary hepotocytes that may be used according to these assays include and liver hepatoma cell line(s) include and liver hepatoma cell line(s) inducible with globocostroids, insiding, or cAMP derivatives.      | Assays for the regulation of ransacription of Malie Enzyme are well-known in the art and may be used or rentinely modified to assess the ability of polypeptides of the apility of polypeptides of the agonists or antagoniss or the agoniss or antagoniss of the agoniss or antagoniss of the factorion (to delighter transcription of Malie Enzyme, a key enzyme in Malie Enzyme, a key enzyme in involved in innecessisand its involved in innecessisand its                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 18 | HFFAD59 | 485 | Activation of transcription through serum response element in immune cells (such as T-cells). | Assays for the activation of transcription through the Serum Response Element (SRE) are well-known in the art and may be used or routinely modified to assess the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | A preferred embodiment of the invention includes a method for inhibiting (e.g., reducing) TNF alpha production. An alternative preferred embodiment of the invention                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| includes a method for stimulating<br>(e.g., increasing) TNF alpha<br>production. Preferred indications | include blood disorders (e.g., as<br>described below under "Immune<br>Activity", "Blood-Related          | Disorders", and/or "Cardiovascular<br>Disorders"), Highly preferred | indications include autoimmune<br>diseases (e.g., rheumatoid arthritis,       | systemic lupus erythematosis,          | croun's disease, intitupie seletosis<br>and/or as described below),         | immunodeficiencies (e.g., as        | described below), boosting a 1 cell-<br>mediated immune response, and | suppressing a T cell-mediated       | immune response. Additional highly | preferred indications include        | inflammation and inflammatory      | disorders, and treating joint damage | in patients with rheumatoid arthritis.  | An additional highly preferred | indication is sepsis. Highly         | preferred indications include  | neoplastic diseases (e.g., leukemia, | lymphoma, and/or as described         | below under "Hyperproliterative  | Disorders"). Additionally, highly | preferred indications include  | neoplasms and cancers, such as, for | example, leukemia, lymphoma, | melanoma, glioma (e.g., malignant | glioma), solid tumors, and prostate, | breast, lung, colon, pancreatic, | esophageal, stomach, brain, liver and<br>urinary cancer. Other preferred |

| ability of polypeptides of the invention (including antibodies and agonists or antagonists of the      | invention) to regulate the serum<br>response factors and modulate the<br>expression of genes involved in | growth. Exemplary assays for<br>transcription through the SRE that  | may be used or routinely modified to<br>test SRE activity of the polypeptides | of the invention (including antibodies | and agonists or amagonists of the<br>invention) include assays disclosed in | Berger et al., Gene 66:1-10 (1998); | Cullen and Malm, Methods in   Enzymol 216:362-368 (1992);             | Henthorn et al., Proc Natl Acad Sci | USA 85:6342-6346 (1988); and       | Black et al., Virus Genes 12(2):105- | 117 (1997), the content of each of | which are herein incorporated by     | reference in its entirety. T cells that | may be used according to these | assays are publicly available (e.g., | through the ATCC1M). Exemplary | mouse T cells that may be used       | according to these assays include the | CTLL cell line, which is an IL-2 | dependent suspension culture of T | cells with cytotoxic activity. |                                     |                              |                                   |                                      |                                  |                                                                          |

| assess the ability of polypeptides of | the invention (including antibodies   | and agonists or antagonists of the   | invention) to stimulate insulin   | secretion. For example, insulin        | secretion is measured by FMAT      | using anti-rat insulin antibodies.   | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Ahren, B., et al., | Am J Physiol, 277(4 Pt 2):R959-66 | (1999); Li, M., et al., Endocrinology, | 138(9):3735-40 (1997); Kim, K.H., | et al., FEBS Lett, 377(2):237-9 | (1995); and, Miraglia S et. al., | Journal of Biomolecular Screening, | 4:193-204 (1999), the contents of      | each of which is herein incorporated | by reference in its entirety.       | Pancreatic cells that may be used    | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated.     | Exemplary pancreatic cells that may | be used according to these assays | include rat INS-1 cells. INS-1 cells   | are a semi-adherent cell line        | established from cells isolated from |

| wound healing, and infection (e.g., infections season disorders as described in the "Infections Sussess and disorders as described in the "Infections Sussess" section below, especially of the urinary tract and skin), carpain under syndrome and Dispoylers is contractured. An additional highly preferred indication is obesity and/or obesity. Additional highly preferred indications include weight loss or alternatively, weight gain. Additional indictions include weight loss or alternatively, weight gain. Additional indications include weight loss or alternatively, weight gain. Additional complications associated with insulin resistance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | A highly profited emboliment of the invention includes a method for stimulating adhocyte prolifection. An alternative highly preferred emboliment of the prolifection. An alternative highly preferred emboliment of the inhibiting adhocyte prolifectation. An alternative prolifectation of the invention includes a method for inhibiting adjocyce prolifectation. An alternative highly preferred embodiment of the invention includes a method for inhibiting adjocyce differentiation. An alternative highly preferred modification includes a method for inhibiting adjocyce differentiation. An alternative highly preferred embolimen of the invention includes a method for inhibiting adjocyce differentiation. A manufacture of the invention includes a method for inhibiting adjocyce differentiation. A manufacture of the invention includes a method for inhibiting adjocyce activation. An alternative includes a method for any anticontain and alternative includes a method for alternative includes a meth |

|--|-----------------------------------------|
|  | concern concerns.                       |
|  | microvascular disease, hypertension,    |
|  | stroke, and other diseases and          |
|  | disorders as described in the           |
|  | "Cardiovascular Disorders" section      |
|  | below), dyslipidemia, endocrine         |
|  | disorders (as described in the          |
|  | "Endocrine Disorders" section           |
|  | below), neuropathy, vision              |
|  | impairment (e.g., diabetic retinopathy  |
|  | and blindness), ulcers and impaired     |
|  | wound healing, infection (e.g.,         |
|  | infectious diseases and disorders as    |
|  | described in the "Infectious            |
|  | Diseases" section below (particularly   |
|  | of the urinary tract and skin). An      |
|  | additional highly preferred indication  |
|  | is obesity and/or complications         |
|  | associated with obesity. Additional     |
|  | highly preferred indications include    |
|  | weight loss or alternatively, weight    |
|  | gain. Additional highly                 |
|  | preferred indications are               |
|  | complications associated with insulin   |
|  | resistance. Additional highly           |
|  | preferred indications are disorders of  |
|  | the musculoskeletal systems             |
|  | including myopathies, muscular          |
|  | dystrophy, and/or as described          |
|  | herein. Additional highly               |
|  | preferred indications include,          |
|  | hypertension, coronary artery           |
|  | disease, dyslipidemia, gallstones,      |
|  | osteoarthritis, degenerative arthritis, |
|  | eating disorders, fibrosis, cachexia,   |
|  | and kidney diseases or disorders.       |
|  | Preferred indications include           |

| adinocyte differentiation A       | highly preferred embodiment of the | invention includes a method for | stimulating (e.g., increasing)        | adipocyte activation. An alternative  | highly preferred embodiment of the     | invention includes a method for | inhibiting the activation of (e.g., | decreasing) and/or inactivating | adipocytes. Highly preferred        | indications include endocrine     | disorders (e.g., as described below | under "Endocrine Disorders").    | Highly preferred indications also | include neoplastic diseases (e.g., | lipomas, liposarcomas, and/or as | described below under            | "Hyperproliferative Disorders").     | Preferred indications include blood | disorders (e.g., hypertension,       | congestive heart failure, blood vessel | blockage, heart disease, stroke,  | impotence and/or as described below | under "Immune Activity",           | "Cardiovascular Disorders", and/or | "Blood-Related Disorders"), immune     | disorders (e.g., as described below | under "Immune Activity"), neural     | disorders (e.g., as described below | under "Neural Activity and   | Neurological Diseases"), and        | infection (e.g., as described below | under "Infectious Disease"). | A highly preferred indication is | diabetes mellitus. An additional | highly preferred indication is a<br>complication associated with |

| embodiment of the invention<br>includes a method for inhibiting  | adipocyte proliferation. A             | preferred embodiment of the         | invention includes a method for | stimulating adipocyte differentiation. | An alternative highly preferred | embodiment of the invention            | includes a method for inhibiting | adipocyte differentiation. Highly | preferred indications include       | endocrine disorders (e.g., as | described below under "Endocrine     | Disorders"). Preferred indications | include neoplastic diseases (e.g., | lipomas, liposarcomas, and/or as     | described below under          | "Hyperproliferative Disorders"),     | blood disorders (e.g., hypertension, | congestive heart failure, blood vessel | blockage, heart disease, stroke, | impotence and/or as described below | under "Immune Activity",         | "Cardiovascular Disorders", and/or    | "Blood-Related Disorders"), immune | disorders (e.g., as described below  | under "Immune Activity"), neural | disorders (e.g., as described below | under "Neural Activity and          | Neurological Diseases"), and | infection (e.g., as described below | under "Infectious Disease"). A | highly preferred indication is | diabetes mellitus. An | additional highly preferred indication | is a complication associated with | diabetes (e.g., diabetic retinopathy, |
| metabolism and cell survival.<br>Exemplary assays for PI3 kinase | activity that may be used or routinely | modified to test PI3 kinase-induced | activity of polypeptides of the | invention (including antibodies and    | agonists or antagonists of the  | invention) include assays disclosed in | Forrer et al., Biol Chem 379(8-  | 9):1101-1110 (1998); Nikoulina et | al., Diabetes 49(2):263-271 (2000); | and Schreyer et al., Diabetes | 48(8):1662-1666 (1999), the contents | of each of which are herein        | incorporated by reference in its   | entirety. Mouse adipocyte cells that | may be used according to these | assays are publicly available (e.g., | through the ATCCTM). Exemplary       | mouse adipocyte cells that may be      | used according to these assays   | include 3T3-L1 cells. 3T3-L1 is an  | adherent mouse preadipocyte cell | line that is a continous substrain of | 3T3 fibroblast cells developed     | through clonal isolation and undergo | a pre-adipocyte to adipose-like  | conversion under appropriate        | differentiation conditions known in | the art.                     |                                     |                                |                                |                       |                                        |                                   |                                       |
|                                                                  |                                        |                                     |                                 |                                        |                                 |                                        |                                  |                                   |                                     |                               |                                      |                                    |                                    |                                      |                                |                                      |                                      |                                        |                                  |                                     |                                  |                                       |                                    |                                      |                                  |                                     |                                     |                              |                                     |                                |                                |                       |                                        |                                   |                                       |

|                                                                                                                                                                                                                                                                                                                                                                                                         | A highly perferred embediment of the invention includes a method for scinning adiptocyte for scinning adiptocyte proliferation. An alternative highly preferred embediment of the invention includes a method for inhibiting adipcyte proliferation. A highly preferred embediment of the invention includes a method for inhibiting adipcyte proliferation. A highly preferred embediment of the invention includes a method for adipcyce differentiation. A display preferred embediment of the invention includes a method for adipcyce differentiation. A highly preferred embediment of the adipcyce distributing (e.g., increasing) addipcyces distribution. A highly preferred embediment of the adipcyce distribution and adipcyces. In invention in adipcyce distribution of (e.g., increasing) addipcyces. Illighly preferred embediment of the decreasing and invention in indications indications include endocrine indications and indications include endocrine indications are indications increasing indications increasing indications increasing indications |
| contents of each of which is breein in surpoyned by televence in its entirely. Cells that may be used enought of better assers are publicly available (e.g., through the ATC/TV) available (e.g., through the ATC/TV). Exemplary cells that may be used andor may be nothinely generated. Exemplary cells that may be used according to these assays include according to these assays include (MAYEC). | ceample an Elei Kinase sassy, for<br>the Res spart Intendention that regulate<br>cell pondification or differentiation<br>to pondification or differentiation<br>or differentiation or differentiation<br>to differentiation or differentiation<br>are well known in the art and may be<br>used or routinely modified to assess<br>invention (including authorities and<br>agonists or amagonists or the<br>agonists or amagonists or the<br>proliferentiation. Exemplary mouse adipocyte cells that may be used according to these assays include 3T3-LL cells. 3T3-LL is an addrerent mouse preadpocyte cell | line that is a continuous substrain of 313 fibooblast cells developed through clonal isolation and undergo a pre-adiposyte to adipose-like conversion under appropriate differentiation conditions known in 11th and                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| immunonodulatory genes. NFKB is | important in the pathogenesis of | asthma. Exemplary assays for | transcription through the NFKB | response element that may be used or | rountinely modified to test NFKB- | response element activity of | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | assavs disclosed in Berger et al | Gene 66:1-10 (1998): Cullen and | Malm Methods in Enzymol | 216:362-368 (1992): Henthorn et al | Proc Natl Acad Sci USA 85:6342- | 6346 (1988); Marone et al, Int Arch | Allergy Immunol 114(3):207-17 | (1997), the contents of each of which | are herein incorporated by reference | in its entirety. Cells were pretreated | with SID supernatants or controls for | 15-18 hours, and then 10 ng/mL of | TNF was added to stimulate the | NFkB reporter. SEAP activity was | measured after 48 hours. Basophils | that may be used according to these | assays are publicly available (e.g., | through the ATCCTM). Exemplary | human basophil cell lines that may be | used according to these assays | include Ku812, originally established | from a patient with chronic | myelogenous leukemia. It is an | immature prebasophilic cell line that | can be induced to differentiate into | mature basophils. See, Kishi et al., | Leuk Res. 9:381-390 (1985); Blom et |

| TOT SUITIBLIANDED OF THIS MINISTERIOR  | comusion, drowsmess, nonkerone         |
|----------------------------------------|----------------------------------------|
| (from pancreatic cells) by             | hyperglycemic-hyperosmolar coma,       |
| polypeptides of the invention          | cardiovascular disease (e.g., heart    |
| (including antibodies and agonists or  | disease, atherosclerosis,              |
| antagonists of the invention) include  | microvascular disease, hypertension,   |
| assays disclosed in: Shimizu, H., et   | stroke, and other diseases and         |
| al., Endocr J, 47(3):261-9 (2000);     | disorders as described in the          |
| Salapatck, A.M., et al., Mol           | "Cardiovascular Disorders" section     |
| Endocrinol, 13(8):1305-17 (1999);      | below), dyslipidemia, endocrine        |
| Filipsson, K., et al., Ann N Y Acad    | disorders (as described in the         |
| Sci, 865:441-4 (1998); Olson, L.K.,    | "Endocrine Disorders" section          |
| et al., J Biol Chem, 271(28):16544-    | below), neuropathy, vision             |
| 52 (1996); and, Miraglia S et. al.,    | impairment (e.g., diabetic retinopathy |
| Journal of Biomolecular Screening,     | and blindness), ulcers and impaired    |
| 4:193-204 (1999), the contents of      | wound healing, and infection (e.g.,    |
| each of which is herein incorporated   | infectious diseases and disorders as   |
| by reference in its entirety.          | described in the "Infectious           |
| Pancreatic cells that may be used      | Diseases" section below, especially    |
| according to these assays are publicly | of the urinary tract and skin), carpal |
| available (e.g., through the ATCCTM)   | tunnel syndrome and Dupuytren's        |
| and/or may be routinely generated.     | contracture). An additional            |
| Exemplary pancreatic cells that may    | highly preferred indication is obesity |
| be used according to these assays      | and/or complications associated with   |
| include HITT15 Cells. HITT15 are       | obesity. Additional highly preferred   |
| an adherent epithelial cell line       | indications include weight loss or     |
| established from Syrian hamster islet  | alternatively, weight gain. Additional |
| cells transformed with SV40. These     | highly preferred indications are       |
| cells express glucagon, somatostatin,  | complications associated with insulin  |
| and glucocorticoid receptors. The      | resistance.                            |
| cells secrete insulin, which is        |                                        |
| stimulated by glucose and glucagon     |                                        |
| and suppressed by somatostatin or      |                                        |
| glucocorticoids. ATTC# CRL-1777        |                                        |

| invention) include assays disclosed in       | preferred embodiment of the             |
| Forrer et al., Biol Chem 379(8-              | invention includes a method for         |
| 9):1101-1110 (1998); Nikoulina et            | stimulating muscle cell                 |
| al., Diabetes 49(2):263-271 (2000);          | differentiation. In a specific          |
| and Schreyer et al., Diabetes                | embodiment, skeletal muscle cell        |
| 48(8):1662-1666 (1999), the contents         | differentiation is stimulated. An       |
| of each of which are herein                  | alternative highly preferred            |
| incorporated by reference in its             | embodiment of the invention             |
| entirety. Rat myoblast cells that may        | includes a method for inhibiting        |
| be used according to these assays are        | muscle cell differentiation. In a       |
| publicly available (e.g., through the        | specific embodiment, skeletal muscle    |
| ATCC <sup>TM</sup> ). Exemplary rat myoblast | cell differentiation is inhibited.      |
| cells that may be used according to          | Highly preferred indications include    |
| these assays include L6 cells. L6 is         | disorders of the musculoskeletal        |
| an adherent rat myoblast cell line,          | system. Preferred indications           |
| isolated from primary cultures of rat        | include neoplastic diseases (e.g., as   |
| thigh muscle, that fuses to form             | described below under                   |
| multinucleated myotubes and striated         | "Hyperproliferative Disorders"),        |
| fibers after culture in differentiation      | endocrine disorders (e.g., as           |
| media.                                       | described below under "Endocrine        |
|                                              | Disorders"), neural disorders (e.g., as |
|                                              | described below under "Neural           |
|                                              | Activity and Neurological               |
|                                              | Diseases"), blood disorders (e.g., as   |
|                                              | described below under "Immune           |
|                                              | Activity", "Cardiovascular              |
|                                              | Disorders", and/or "Blood-Related       |
|                                              | Disorders"), immune disorders (e.g.,    |
|                                              | as described below under "Immune        |
|                                              | Activity"), and infection (e.g., as     |
|                                              | elov                                    |
|                                              | Disease"). A highly preferred           |
|                                              | indication is diabetes mellitus.        |
|                                              | An additional highly preferred          |
|                                              | indication is a complication            |
|                                              | associated with diabetes (e.g.,         |

|  |  | diahetic retinonathy diahetic          |
|--|--|----------------------------------------|
|  |  | manora remobanty, manora               |
|  |  | nephropathy, kidney disease (e.g.,     |
|  |  | renal failure, nephropathy and/or      |
|  |  | other diseases and disorders as        |
|  |  | described in the "Renal Disorders"     |
|  |  | section below), diabetic neuropathy,   |
|  |  | nerve disease and nerve damage (e.g,   |
|  |  | due to diabetic neuropathy), blood     |
|  |  | vessel blockage, heart disease,        |
|  |  | stroke, impotence (e.g., due to        |
|  |  | diabetic neuropathy or blood vessel    |
|  |  | blockage), seizures, mental            |
|  |  | confusion, drowsiness, nonketotic      |
|  |  | hyperglycemic-hyperosmolar coma,       |
|  |  | cardiovascular disease (e.g., heart    |
|  |  | disease, atherosclerosis,              |
|  |  | microvascular disease, hypertension,   |
|  |  | stroke, and other diseases and         |
|  |  | disorders as described in the          |
|  |  | "Cardiovascular Disorders" section     |
|  |  | below), dyslipidemia, endocrine        |
|  |  | disorders (as described in the         |
|  |  | "Endocrine Disorders" section          |
|  |  | below), neuropathy, vision             |
|  |  | impairment (e.g., diabetic retinopathy |
|  |  | and blindness), ulcers and impaired    |
|  |  | wound healing, infections (e.g.,       |
|  |  | infectious diseases and disorders as   |
|  |  | described in the "Infectious           |
|  |  | Diseases" section below, especially    |
|  |  | of the urinary tract and skin), carpal |
|  |  | tunnel syndrome and Dupuytren's        |
|  |  | contracture). An additional            |
|  |  | highly preferred indication is obesity |
|  |  | and/or complications associated with   |
|  |  | obesity. Additional highly preferred   |
|  |  | indications include weight loss or     |

|     |         |     |                      |                                          | alternatively, weight gain. Additional highly preferred indications are complications |

| (e.g., through the ATCC <sup>TM</sup> ) and/or | and/or complications associated with   |
| may be routinely generated.                    | obesity. Additional highly preferred   |
| Exemplary hepatocytes that may be              | indications include weight loss or     |
| used according to these assays                 | alternatively, weight gain.            |

| production. An alternative highly    | preferred embodiment of the         | invention includes a method for | inhibiting (e.g., reducing) IL-6 | production. A highly preferrred       | indication is the stimulation or   | enhancement of mucosal immunity. | Highly preferred indications include | blood disorders (e.g., as described | below under "Immune Activity",  | "Blood-Related Disorders", and/or    | "Cardiovascular Disorders"), and       | infection (e.g., as described below | under "Infectious Disease"). Highly | preferred indications include       | autoimmune diseases (e.g.,       | rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis   | and/or as described below) and | immunodeficiencies (e.g., as | described below). Highly preferred | indications also include boosting a B | cell-mediated immune response and |                                | -                                  | preferred indications include        | inflammation and inflammatory | disorders. Additional highly preferred | indications include asthma and  | allergy. Highly preferred indications | include neoplastic diseases (e.g., | myeloma, plasmacytoma, leukemia, | lymphoma, melanoma, and/or as | described below under                 | "Hyperproliferative Disorders").      | Highly preferred indications include   | neoplasms and cancers, such as, |
|--------------------------------------|-------------------------------------|---------------------------------|----------------------------------|---------------------------------------|------------------------------------|----------------------------------|--------------------------------------|-------------------------------------|---------------------------------|--------------------------------------|----------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|----------------------------------|--------------------------------------|-------------------------------------|--------------------------------|------------------------------|------------------------------------|---------------------------------------|-----------------------------------|--------------------------------|------------------------------------|--------------------------------------|-------------------------------|----------------------------------------|---------------------------------|---------------------------------------|------------------------------------|----------------------------------|-------------------------------|---------------------------------------|---------------------------------------|----------------------------------------|---------------------------------|
| induced IgE production and increases | IgA production (IgA plays a role in | mucosal immunity). IL-6 induces | cytotoxic T cells. Deregulated   | expression of IL-6 has been linked to | autoimmune disease, plasmacytomas, | myelomas, and chronic            | hyperproliferative diseases. Assays  | for immunomodulatory and            | differentiation factor proteins | produced by a large variety of cells | where the expression level is strongly | regulated by cytokines, growth      | factors, and hormones are well      | known in the art and may be used or | routinely modified to assess the | ability of polypeptides of the       | invention (including antibodies and | agonists or antagonists of the | invention) to mediate        | immunomodulation and               | differentiation and modulate T cell   | proliferation and function.       | Exemplary assays that test for | immunomodulatory proteins evaluate | the production of cytokines, such as | IL-6, and the stimulation and | upregulation of T cell proliferation   | and functional activities. Such | assays that may be used or routinely  | modified to test immunomodulatory  | and diffferentiation activity of | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Miraglia et al., J | Biomolecular Screening 4:193-   |
|                                      |                                     |                                 |                                  |                                       |                                    |                                  |                                      |                                     |                                 |                                      |                                        |                                     |                                     |                                     |                                  |                                      |                                     |                                |                              |                                    |                                       |                                   |                                |                                    |                                      |                               |                                        |                                 |                                       |                                    |                                  |                               |                                       |                                       |                                        |                                 |

|  | below under "Hyperproliferative         |
|--|-----------------------------------------|
|  | Disorders"), and disorders of the       |
|  | cardiovascular system (e.g., heart      |
|  | disease, congestive heart failure,      |
|  | hypertension, aortic stenosis,          |
|  | cardiomyopathy, valvular                |
|  | regurgitation, left ventricular         |
|  | dysfunction, atherosclerosis and        |
|  | atherosclerotic vascular disease,       |
|  | diabetic nephropathy, intracardiac      |
|  | shunt, cardiac hypertrophy,             |
|  | myocardial infarction, chronic          |
|  | hemodynamic overload, and/or as         |
|  | described below under                   |
|  | "Cardiovascular Disorders"). Highly     |
|  | preferred indications include           |
|  | cardiovascular, endothelial and/or      |
|  | angiogenic disorders (e.g., systemic    |
|  | disorders that affect vessels such as   |
|  | diabetes mellitus, as well as diseases  |
|  | of the vessels themselves, such as of   |
|  | the arteries, capillaries, veins and/or |
|  | lymphatics). Highly preferred are       |
|  | indications that stimulate              |
|  | angiogenesis and/or                     |
|  | cardiovascularization. Highly           |
|  | preferred are indications that inhibit  |
|  |                                         |
|  | cardiovascularization. Highly           |
|  | preferred indications include           |
|  | antiangiogenic activity to treat solid  |
|  | tumors, leukemias, and Kaposi"s         |
|  | sarcoma, and retinal disorders.         |
|  | Highly preferred indications include    |
|  | neoplasms and cancer, such as,          |
|  | Kaposi"s sarcoma, hemangioma            |
|  | (capillary and cavernous), glomus       |

|  |  | tumors, telangiectasia, bacillary      |
|--|--|----------------------------------------|
|  |  | angiomatosis,                          |
|  |  | hemangioendothelioma,                  |
|  |  | angiosarcoma,                          |
|  |  | haemangiopericytoma,                   |
|  |  | lymphangioma, lymphangiosarcoma.       |
|  |  | Highly preferred indications also      |
|  |  | include cancers such as, prostate,     |
|  |  | breast, lung, colon, pancreatic,       |
|  |  | esophageal, stomach, brain, liver,     |
|  |  | and urinary cancer. Preferred          |
|  |  | indications include benign             |
|  |  | dysproliferative disorders and pre-    |
|  |  | neoplastic conditions, such as, for    |
|  |  | example, hyperplasia, metaplasia,      |
|  |  | and/or dysplasia. Highly               |
|  |  | 8                                      |
|  |  | arterial disease, such as,             |
|  |  | atherosclerosis, hypertension,         |
|  |  | coronary artery disease,               |
|  |  | inflammatory vasculitides,             |
|  |  | Reynaud"s disease and Reynaud"s        |
|  |  | phenomenom, aneurysms, restenosis;     |
|  |  | venous and lymphatic disorders such    |
|  |  | as thrombophlebitis, lymphangitis,     |
|  |  | and lymphedema; and other vascular     |
|  |  | disorders such as peripheral vascular  |
|  |  | disease, and cancer. Highly            |
|  |  | preferred indications also include     |
|  |  | trauma such as wounds, burns, and      |
|  |  | injured tissue (e.g., vascular injury  |
|  |  | such as, injury resulting from balloon |
|  |  | angioplasty, and atheroschlerotic      |
|  |  | lesions), implant fixation, scarring,  |
|  |  | ischemia reperfusion injury,           |
|  |  | rheumatoid arthritis, cerebrovascular  |
|  |  | disease, renal diseases such as acute  |

| For example, the Cell Titer-Glo      | luminescent cell viability assay | measures the number of viable cells | in culture based on quantitation of   | the ATP present which signals the | presence of metabolically active    | cells. Exemplary assays that may be | used or routinely modified to test | regulation of viability and      | proliferation of pancreatic beta cells | by polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Ohtani KI, et al., | Endocrinology, 139(1):172-8 (1998); | Krautheim A, et al, Exp Clin    | Endocrinol Diabetes, 107 (1):29-34 | (1999), the contents of each of which | is herein incorporated by reference in | its entirety. Pancreatic cells that    | may be used according to these      | assays are publicly available (e.g., | through the ATCCTM) and/or may be    | routinely generated. Exemplary | pancreatic cells that may be used   | according to these assays include      | HITT15 Cells. HITT15 are an     | adherent epithelial cell line      | established from Syrian hamster islet  | cells transformed with SV40. These | cells express glucagon, somatostatin, | and glucocorticoid receptors. The  | cells secrete insulin, which is        | stimulated by glucose and glucagon | and suppressed by somatostatin or     | glucocorticoids. ATTC# CRL-1777 | Refs: Lord and Ashcroft. Biochem. |

| culture in differentiation media. | Assays for measuring secretion of | misum are well-known in the art and<br>may be used or routinely modified to | assess the ability of polypeptides of | the invention (including antibodies   | and agonists or antagonists of the   | invention) to stimulate insulin   | secretion. For example, insulin        | secretion is measured by FMAT      | using anti-rat insulin antibodies.   | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Shimizu, H., et | al., Endocr J, 47(3):261-9 (2000); | Salapatek, A.M., et al., Mol       | Endocrinol, 13(8):1305-17 (1999); | Filipsson, K., et al., Ann N Y Acad | Sci, 865:441-4 (1998); Olson, L.K., | et al., J Biol Chem, 271(28):16544- | 52 (1996); and, Miraglia S ct. al.,    | Journal of Biomolecular Screening,  | 4:193-204 (1999), the contents of   | each of which is herein incorporated | by reference in its entirety. | Pancreatic cells that may be used   | according to these assays are publicly | available (e.g., through the ATCCTM) |
|                                   | Insulin Secretion                 |                                                                             |                                       |                                       |                                      |                                   |                                        |                                    |                                      |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                      |                                    |                                    |                                   |                                     |                                     |                                     |                                        |                                     |                                     |                                      |                               |                                     |                                        |                                      |

|  | Malic Enzyme, a key enzyme in                | described in the "Renal Disorders"     |
|  | lipogenesis. Malic enzyme is                 | section below), diabetic neuropathy,   |
|  | involved in lipogenesisand its               | nerve disease and nerve damage         |
|  | expression is stimulted by insulin.          | (e.g., due to diabetic neuropathy),    |
|  | ME promoter contains two direct              | blood vessel blockage, heart disease,  |
|  | repeat (DR1)- like elements MEp              | stroke, impotence (e.g., due to        |
|  | and MEd identified as putative PPAR          | diabetic neuropathy or blood vessel    |
|  | response elements. ME promoter               | blockage), seizures, mental            |
|  | may also responds to AP1 and other           | confusion, drowsiness, nonketotic      |
|  | transcription factors. Exemplary             | hyperglycemic-hyperosmolar coma,       |
|  | assays that may be used or routinely         | cardiovascular disease (e.g., heart    |
|  | modified to test for regulation of           | disease, atherosclerosis,              |
|  | transcription of Malic Enzyme (in            | microvascular disease, hypertension,   |
|  | adipoocytes) by polypeptides of the          | stroke, and other diseases and         |
|  | invention (including antibodies and          | disorders as described in the          |
|  | agonists or antagonists of the               | "Cardiovascular Disorders" section     |
|  | invention) include assays disclosed          | below), dyslipidemia, endocrine        |
|  | in: Streeper, R.S., et al., Mol              | disorders (as described in the         |
|  | Endocrinol, 12(11):1778-91 (1998);           | "Endocrine Disorders" section          |
|  | Garcia-Jimenez, C., et al., Mol              | below), neuropathy, vision             |
|  | Endocrinol, 8(10):1361-9 (1994);             | impairment (e.g., diabetic retinopathy |
|  | Barroso, I., et al., J Biol Chem,            | and blindness), ulcers and impaired    |
|  | 274(25):17997-8004 (1999);                   | wound healing, and infection (e.g.,    |
|  | Ijpenberg, A., et al., J Biol Chem,          | infectious diseases and disorders as   |
|  | 272(32):20108-20117 (1997);                  | described in the "Infectious           |

| cells that may be used according to these assays include or a INS1 cells.  INS1 cells are a somi-adiacent cell line established from cells isolated from an Acry induced its resistance of the control and active the cells retain characteristics typical of the cells retain characteristics typical of the cells retain characteristics typical of all cells retain characteristics typical of all cells retain characteristics typical of all cells retain characteristics to the cells including allocose inducible insulin secretion. Assays for<br>immunomodulatory proteins that<br>induce chemotaxis of T cells, | monocytes, and eosinophils are well | chown in the art and may be used or<br>outinely modified to assess the | ability of polypeptides of the | nvention (including antibodies and | nycution) to mediate | mmunomodulation, induce | chemotaxis, and/or mediate humoral | or cell-mediated immunity. | Exemplary assays that test for | immunomodulatory proteins evaluate | he production of cytokines, such as | RANTES, and the induction of | chemotactic responses in immune | cells. Such assays that may be used | or routinely modified to test | mmunomodulatory activity of | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | the assays disclosed in Miraglia et | al., J Biomolecular Screening 4:193- | 204 (1999); Rowland et al., | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000): Cocchi et | al., Science 270(5243):1811-1815 | 1995); and Robinson et al., Clin Exp | mmumol 101(3):398-407 (1995), the | contents of each of which are herein | incomporated by reference in its |

|                                                          | A highly preferred indication is | diabetes mellitus. An             | additional highly preferred indication | is a complication associated with    | diabetes (e.g., diabetic retinopathy, | diabetic nephropathy, kidney disease | (e.g., renal failure, nephropathy |                                         | _                             | section below), diabetic neuropathy, | nerve disease and nerve damage | (e.g., due to diabetic neuropathy), | blood vessel blockage, heart disease, | stroke, impotence (e.g., due to | _                                   |                                | confusion, drowsiness, nonketotic  | hyperglycemic-hyperosmolar coma, | cardiovascular disease (e.g., heart  | disease, atherosclerosis,          | microvascular disease, hypertension, | stroke, and other diseases and      | disorders as described in the       | "Cardiovascular Disorders" section | below), dyslipidemia, endocrine     | disorders (as described in the  | "Endocrine Disorders" section      | below), neuropathy, vision      | impairment (e.g., diabetic retinopathy | and blindness), ulcers and impaired | wound healing, and infection (e.g., | infectious diseases and disorders as | described in the "Infectious | Discases" section below, especially  | of the urinary tract and skin), carpal |
| are herein incorporated by reference<br>in its entirety. | Assays for the regulation of     | transcription of Malic Enzyme are | well-known in the art and may be       | used or routinely modified to assess | the ability of polypeptides of the    | invention (including antibodies and  | agonists or antagonists of the    | invention) to regulate transcription of | Malic Enzyme, a key enzyme in | lipogenesis. Malic enzyme is         | involved in lipogenesisand its | expression is stimulted by insulin. | ME promoter contains two direct       | repeat (DR1)- like elements MEp | and MEd identified as putative PPAR | response elements. ME promoter | may also responds to AP1 and other | transcription factors. Exemplary | assays that may be used or routinely | modified to test for regulation of | transcription of Malic Enzyme (in    | adipoocytes) by polypeptides of the | invention (including antibodies and | agonists or antagonists of the     | invention) include assays disclosed | in: Streeper, R.S., et al., Mol | Endocrinol, 12(11):1778-91 (1998); | Garcia-Jimenez, C., et al., Mol | Endocrinol, 8(10):1361-9 (1994);       | Barroso, I., et al., J Biol Chem,   | 274(25):17997-8004 (1999);          | ljpenberg, A., et al., J Biol Chem,  | 272(32):20108-20117 (1997);  | Berger, et al., Gene 66:1-10 (1988); | and, Cullen, B., et al., Methods in    |
